Column Chart

Total Sales Performance by Country

Bar Chart

Top-Selling Product Packs Overview

Description

Compares any value by different categories to understand largest or smallest values.

Comparison like Who is best , who is worst , Top 10, bottom 5 etc..

- Sales by Product
- Spend by Expense Category
- Calls Received by Region
- Employee Count by Department

When to Use

When you want to see which category is largest, smallest, or how categories stack up against each other in absolute terms.

- Use a **Column Chart** for fewer categories displayed horizontally (e.g., months or product categories).
- Use a **Bar Chart** if you have longer category names (makes them easier to read on the vertical axis).

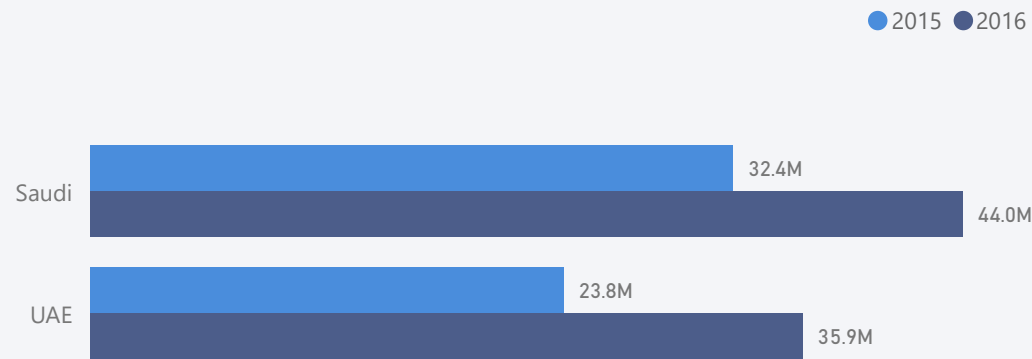

Clustered Bar / Column Chart

Clustered Bar Chart

Yearly Sales Comparison by Country

Description

A Clustered Bar/Column Chart displays multiple sets of data side by side for easy comparison, showing trends or differences across categories. It is especially helpful for comparing related data across the same group, like sales in different years or performance across multiple regions.

- *Yearly Sales Comparison by Country*
- *Regional Manager-wise Sales Trends Over Years*

When to Use

Use a Clustered Bar/Column Chart when you want to compare two or more related measures across categories, such as:

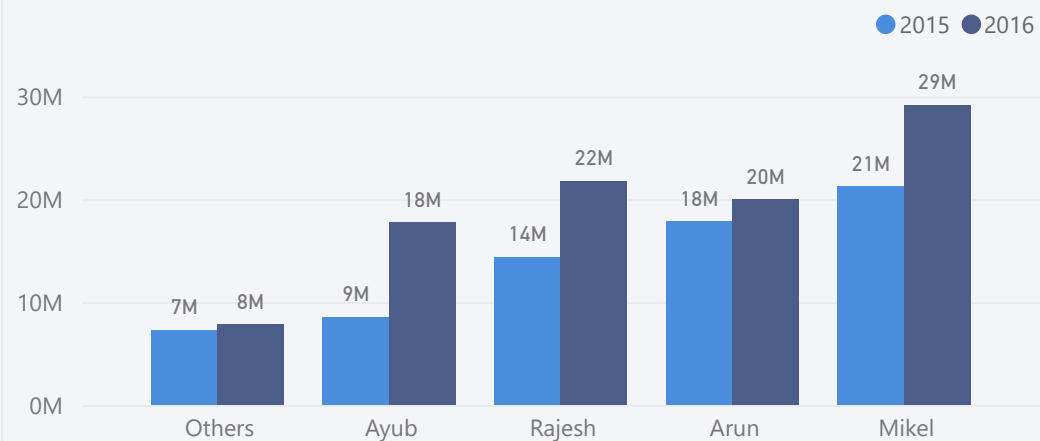

- *Sales in different years*
- *Sales by region or product category*

How to Choose

- **Clustered Bar Chart:** Works well when comparing data horizontally, like when you have fewer categories.
- **Clustered Column Chart:** Works better for comparing data vertically and is suitable for categories that can be easily read along the horizontal axis.

Clustered Column Chart

Regional Manager-wise Sales Trends Over Years

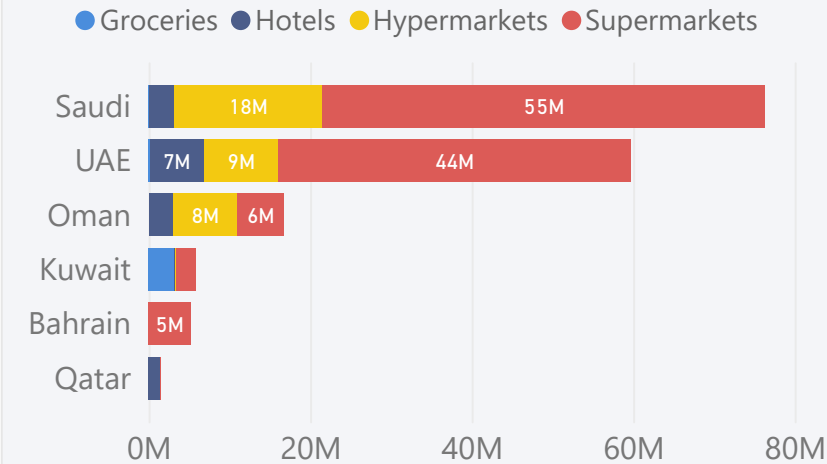

Stacked Bar / Column Chart

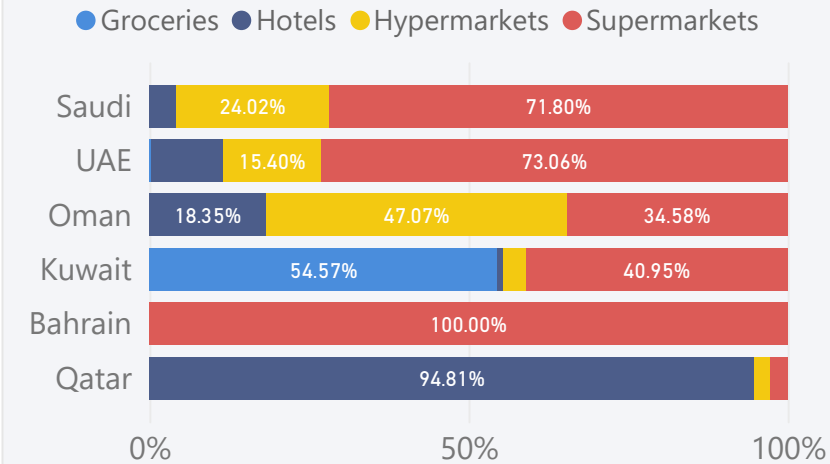

Stacked Bar Chart

Sales Distribution by Country and Customer Type

100% Stacked Bar Chart

Proportional Sales Share by Customer Type (Across Countries)

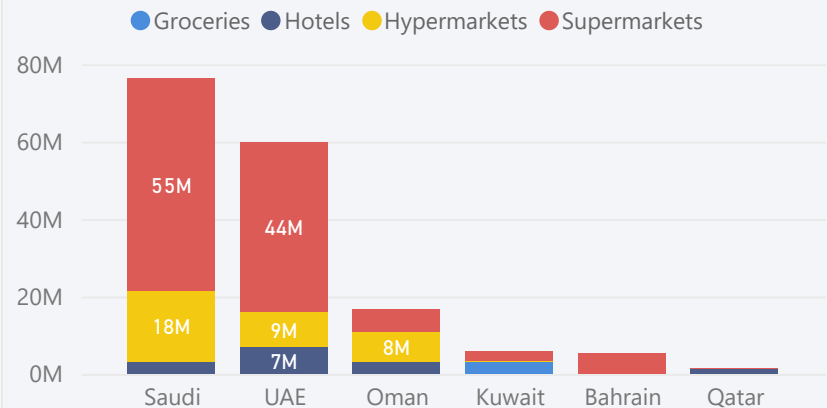

Description

A Stacked Bar/Column Chart displays the total of a measure broken down into subcategories, stacked on top of each other. This allows you to see how each part contributes to the whole, making it ideal for part-to-whole comparisons.

- Sales Distribution by Country and Customer Type
- Country-Wise Sales Volume Split by Customer Type

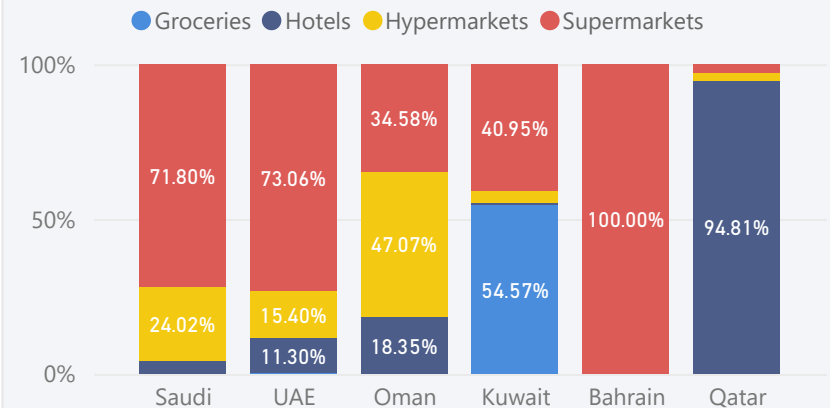

Stacked Column Chart

Country-Wise Sales Volume Split by Customer Type

100% Stacked Column Chart

Country-Wise Percentage Sales Split by Customer Type

When to Use

Use a Stacked Bar/Column Chart when you want to show how each subcategory contributes to the total for a category, such as:

- Sales breakdown by product type in different regions
- Distribution of customer types across countries

How to Choose

- Stacked Bar Chart: Ideal when

Line Chart

Description

A Line Chart connects data points with a line, making it easy to see trends or changes over time. It's particularly useful for tracking continuous data or any data that follows a time-based sequence.

- *Monthly Sales Trend*

When to Use

Use a Line Chart when you want to show how something changes from one period to the next, especially with a continuous or time-based axis, such as:

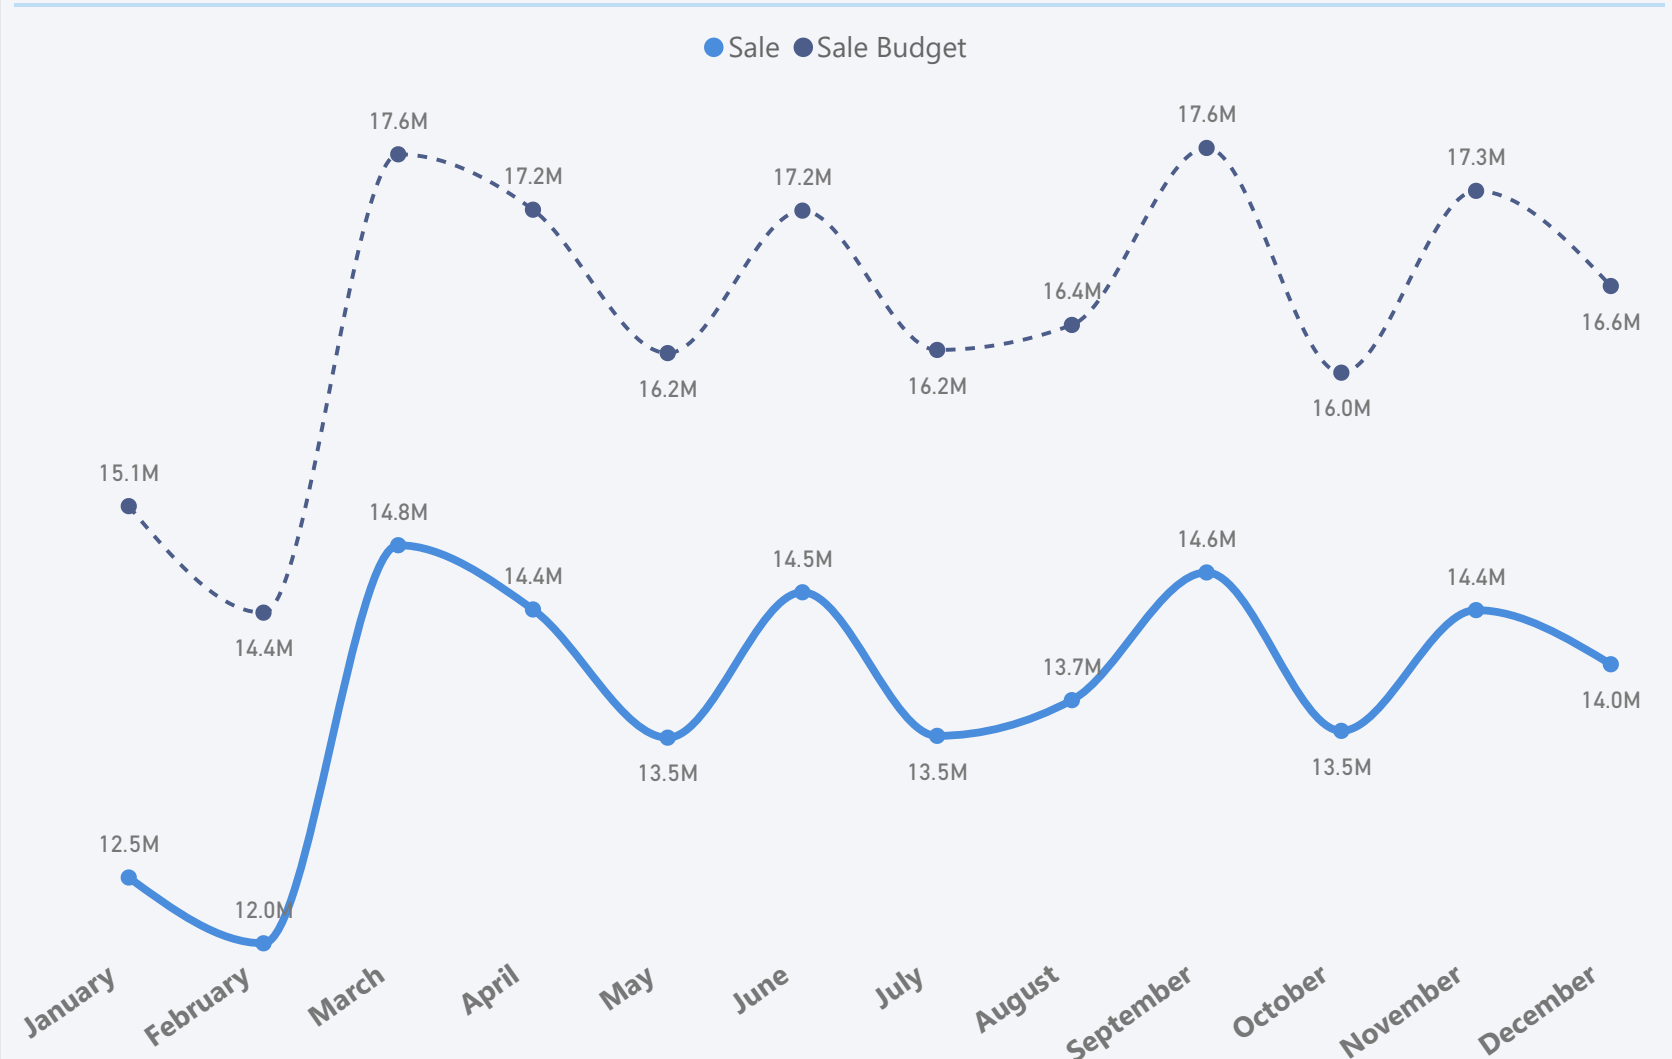

- *Sales growth over the months*
- *Trends in temperature or other measurements over time*

How to Choose

- Keep the chart clean by avoiding too many lines.
- Use labels or color coding to clearly distinguish between different data series or trends.

Line Chart

Monthly Sales vs. Budget Trends

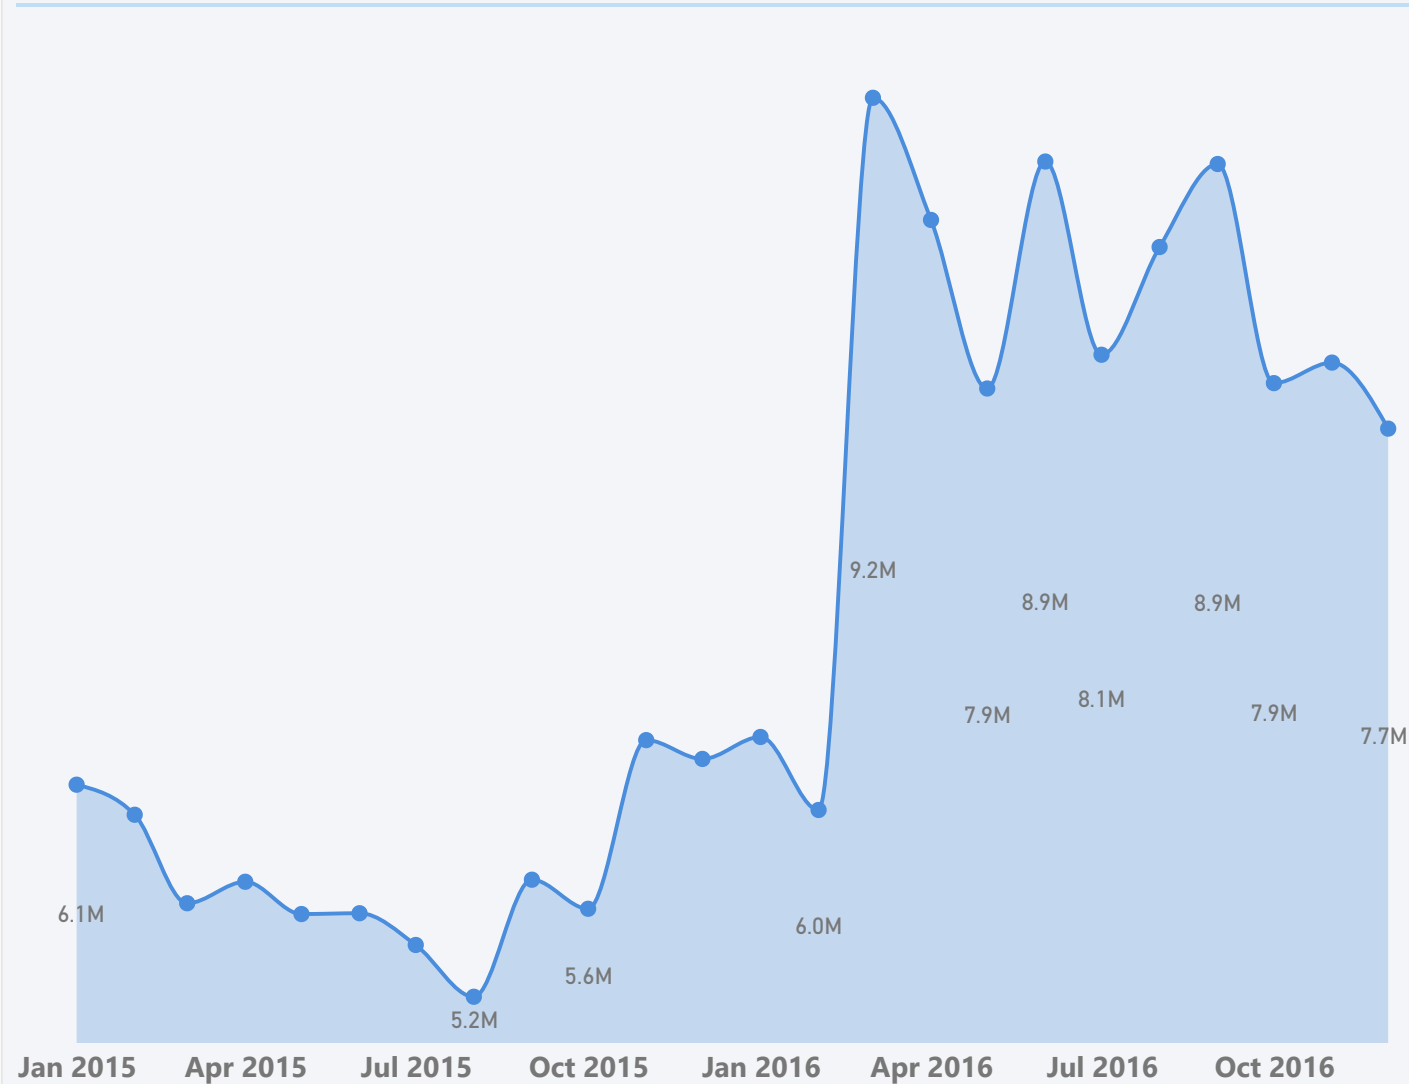

Area Chart

Area Chart

Revenue by Year and Month

Description

An Area Chart is similar to a Line Chart, but with the area below the line filled in. This emphasizes the volume or magnitude of change over time, making it easier to see how values accumulate or change over a period.

• *Revenue by Year and Month*

When to Use

Use an Area Chart when you want to highlight cumulative values or show overall trends more visually, such as:

- *Tracking revenue growth over time*
- *Showing changes in a specific metric across periods*

How to Choose

- An Area Chart is useful for showing volume changes over time.
- Avoid using it when details overlap heavily, as the area can obscure specific data points.

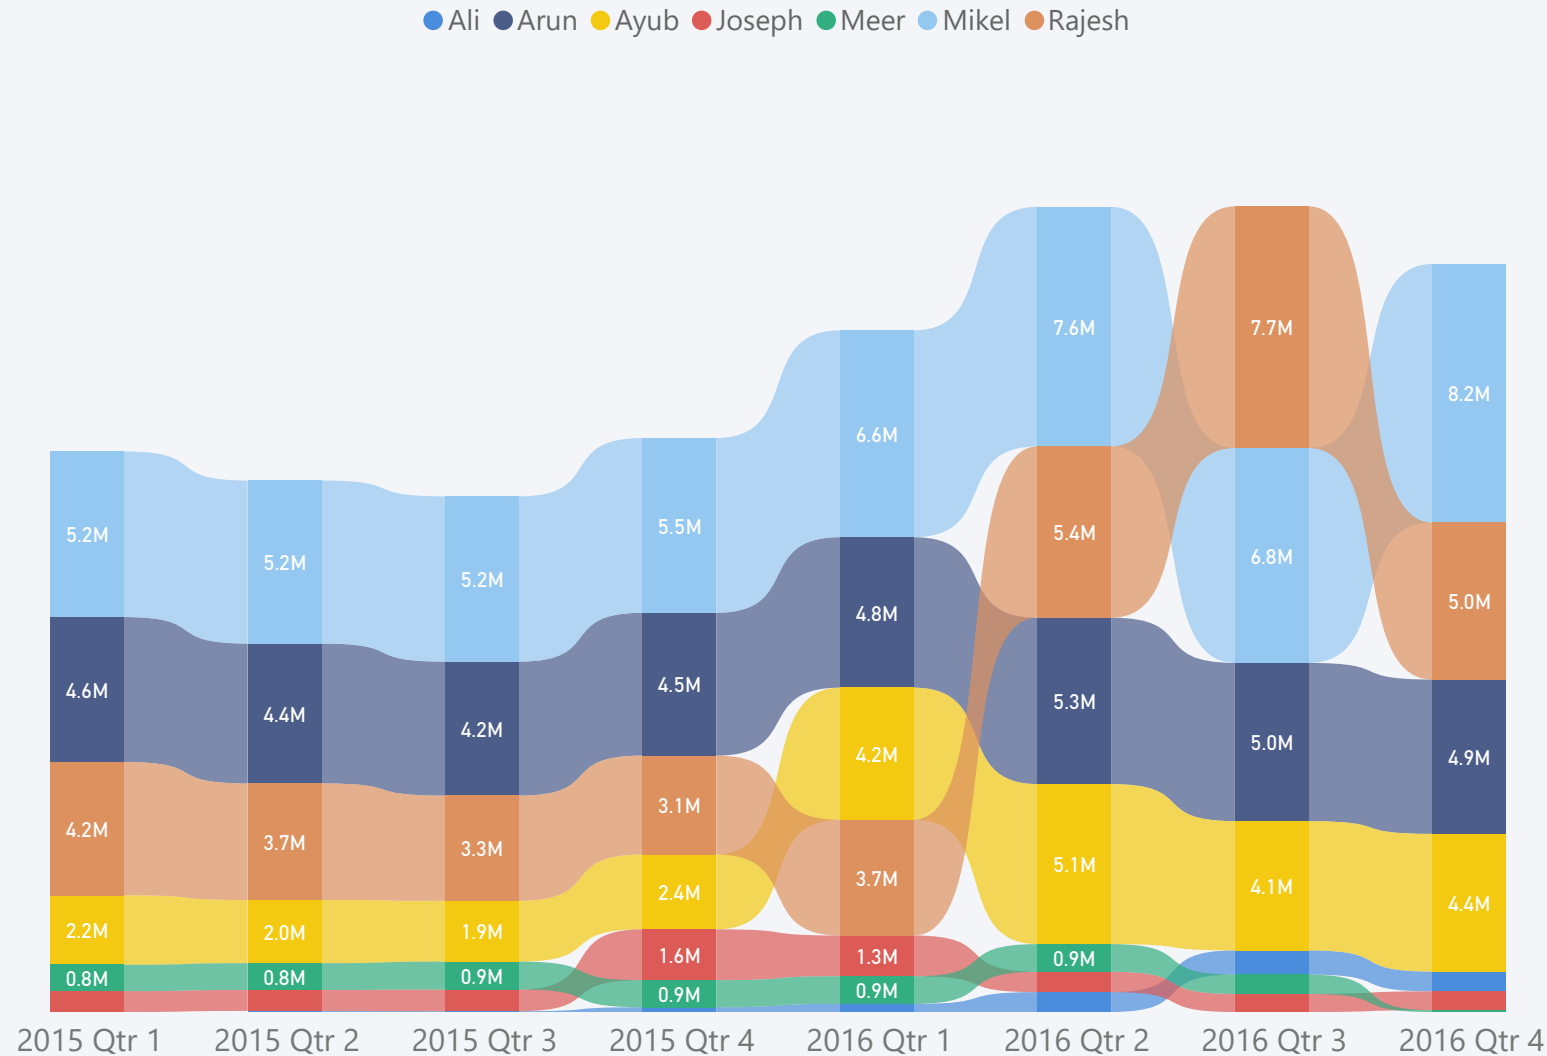

Ribbon Chart

Ribbon Chart

Quarterly Sales Trends by Regional Manager

Description

A Ribbon Chart ranks categories or subcategories over time or another dimension, with "ribbons" that change in thickness and position to indicate shifts in ranking. This chart is great for visualizing how categories move up and down in a ranking.

- Quarterly Sales Trends by Regional Manager

When to Use

Use a Ribbon Chart when you need to show how the top-ranked categories shift or how the ranking order changes over time, such as:

- Sales performance by team or region over multiple quarters
- Tracking shifts in rank or performance

How to Choose

- A Ribbon Chart is a great alternative to bar or line charts if the focus is on "who's on top" or "how the position changes over time."

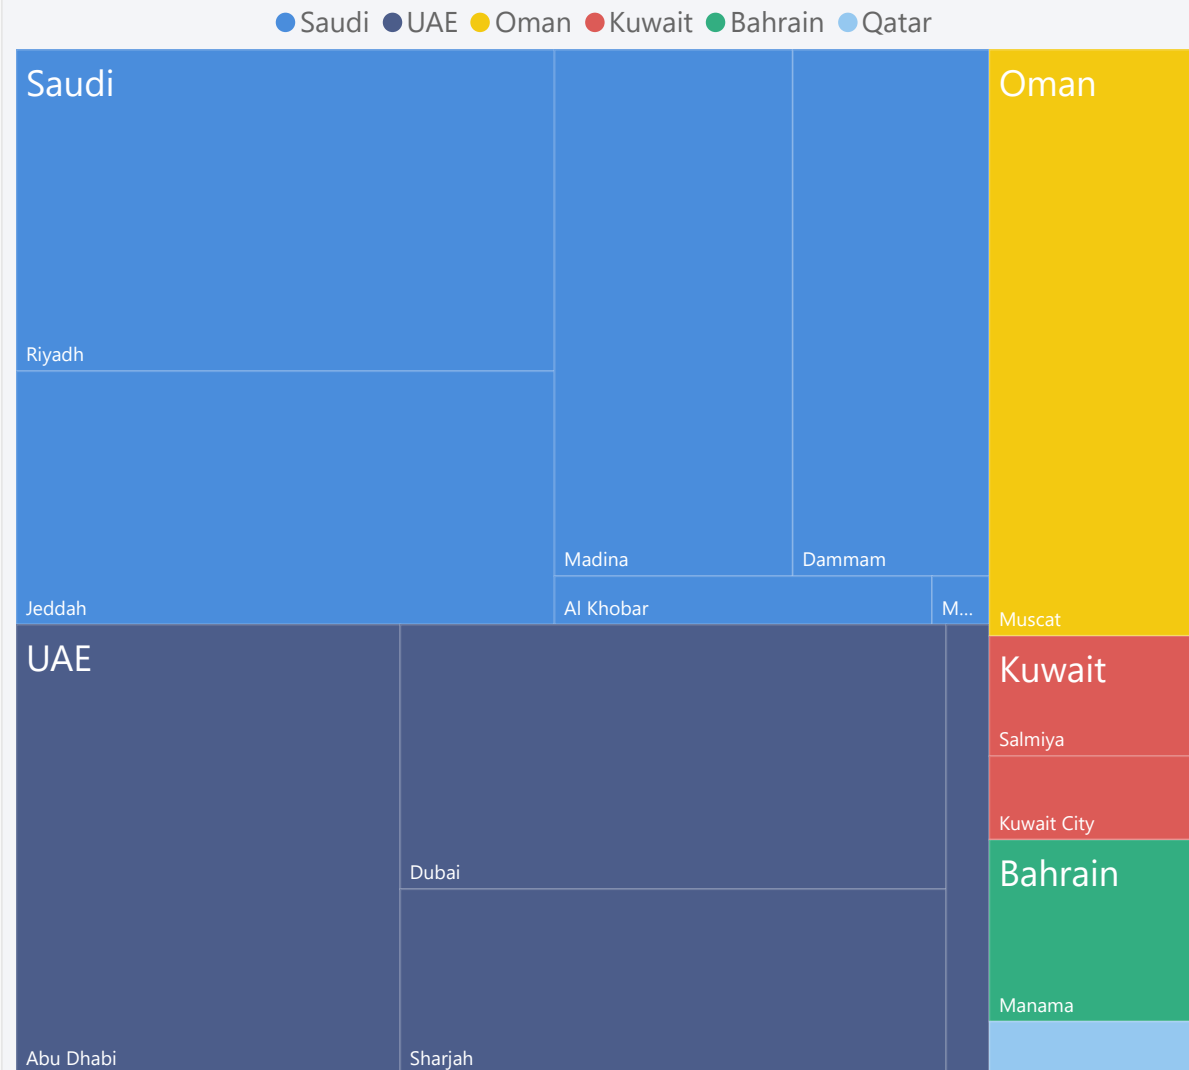

Tree Map

Treemap

Revenue by Country and Area

Description

A Tree Map uses nested rectangles of varying size to represent hierarchical or proportional data. Larger rectangles represent larger data points, and smaller ones represent smaller data points, making it easier to visualize how parts of a whole compare in size.

* *Revenue by Country and Area*

When to Use

Use a Tree Map when you want to show how parts of a hierarchy compare in size to each other or to the whole, such as:

- * *Revenue distribution by country and region*
- * *Sales by category and subcategory*

How to Choose

- * Tree Maps are particularly useful if you have a large number of categories that can be grouped in a hierarchy.
- * They are great for providing a quick, big-picture look at relative sizes across categories.

Stacked Area Chart

Description

A Stacked Area Chart displays data series "stacked" on top of each other. It emphasizes both the overall trend (the upper boundary of the stacked area) and the contribution of each category to the total over time. This makes it ideal for comparing how different categories contribute to the total value over a period.

** Regional Revenue Growth Over Time*

When to Use

Use a Stacked Area Chart when you need to see how different categories add up over time and want to compare their contributions to the overall trend, such as:

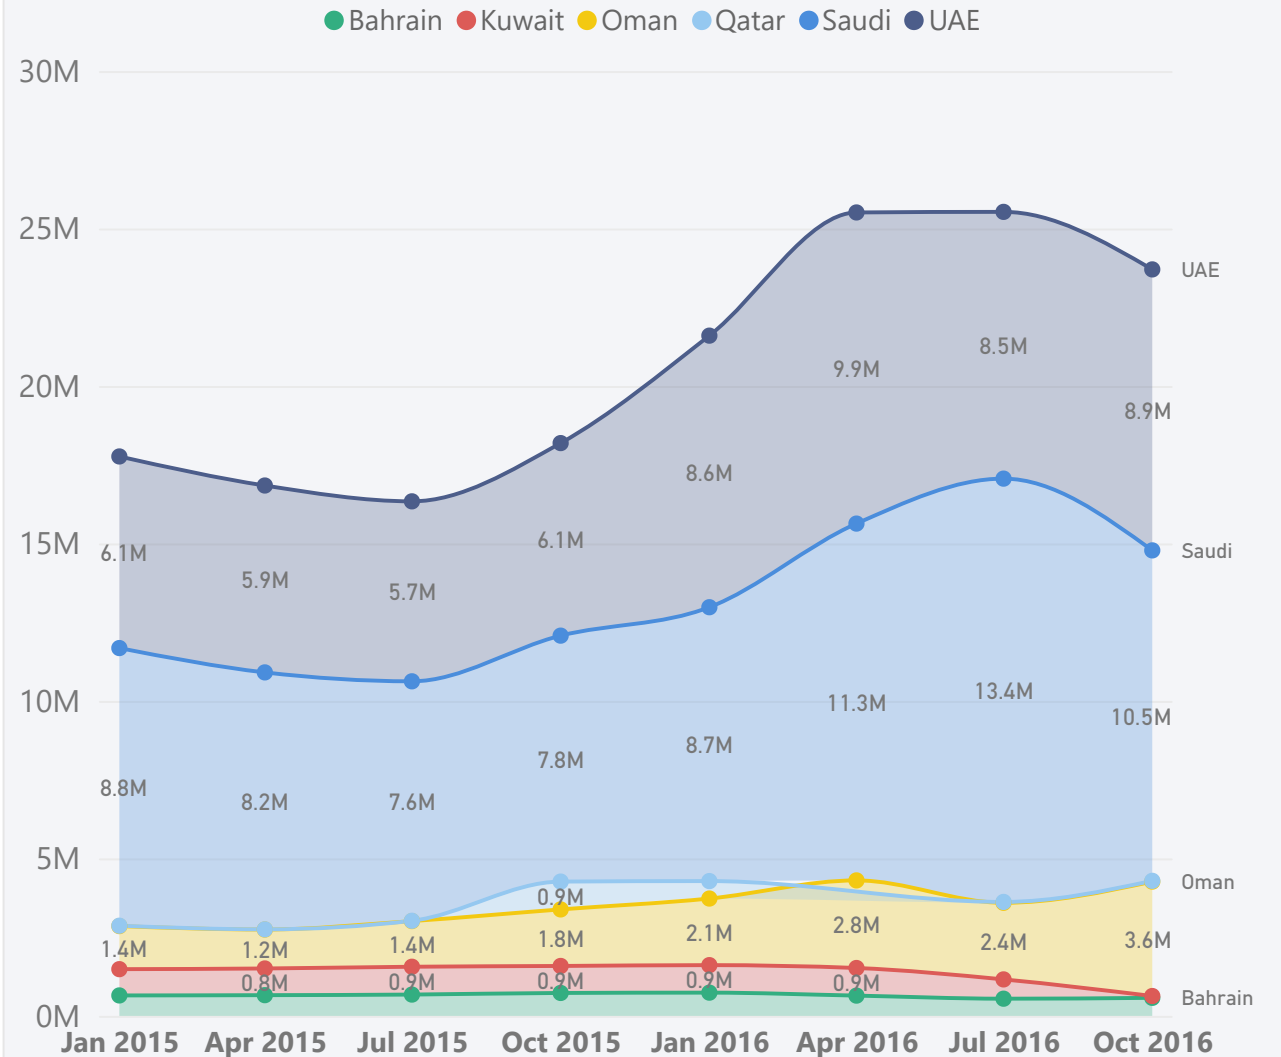

- * Revenue growth from different regions over multiple years*
- * Changes in sales by product category over time*

How to Choose

- * Limit the number of categories to avoid clutter.
- * Use distinct colors and a clear legend so each area is easily recognizable.
- * Focus on the top boundary for the total trend and each colored area to see the sub-category's contribution.

Stacked Area Chart

Regional Revenue Growth Over Time

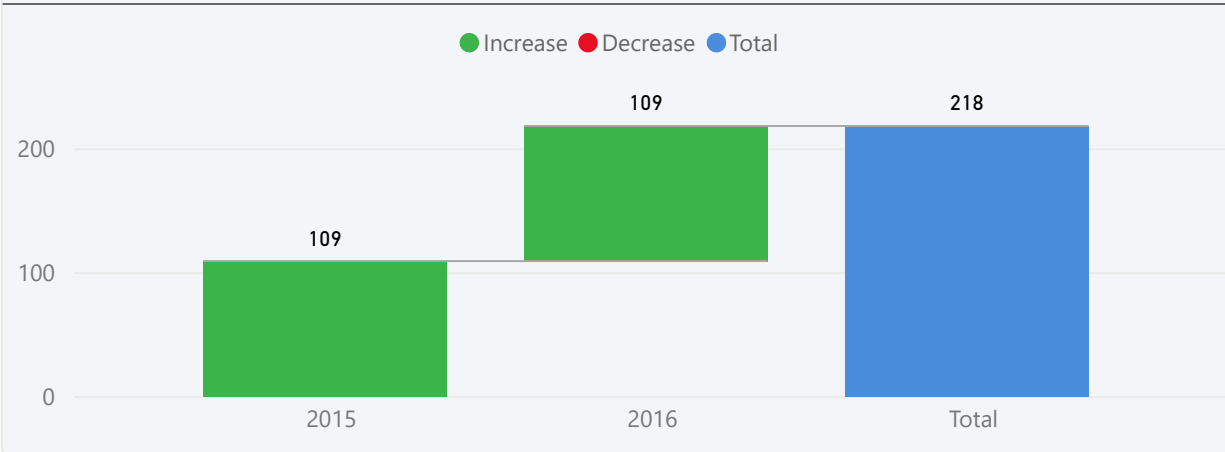

Waterfall Chart

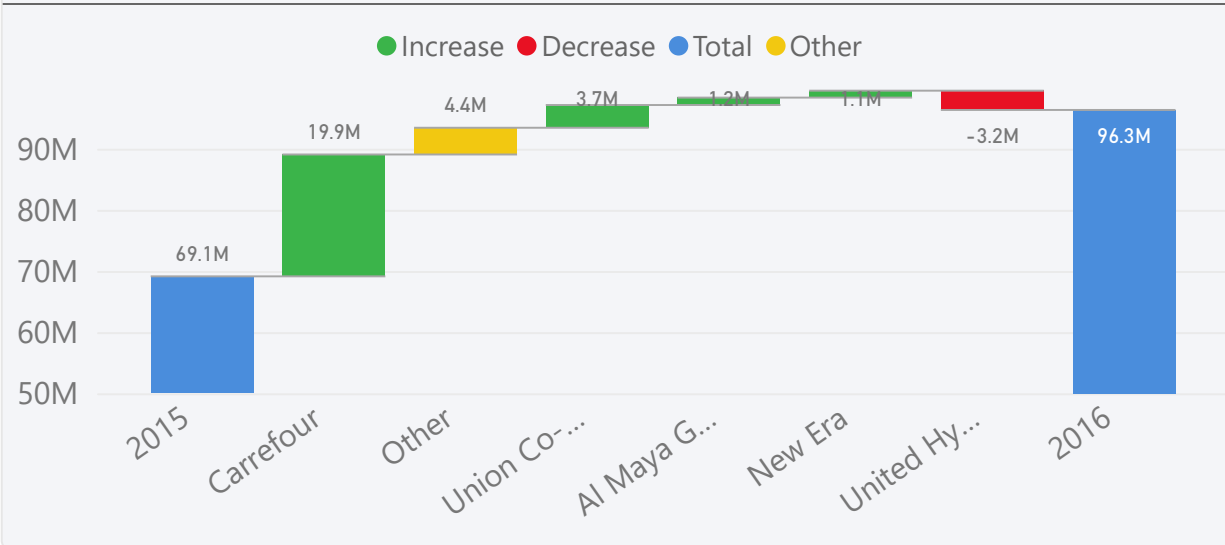

Waterfall Chart

Annual Contribution Breakdown and Final Value

Waterfall Chart

Sales Impact by Party from 2015 to 2016

Description

A Waterfall Chart tracks the cumulative effect of sequential positive and negative values, starting from an initial value and arriving at a final total. It's used to show how individual changes (additions and subtractions) lead to a final net outcome.

• *Annual Contribution Breakdown and Final Value*

When to Use

Use a Waterfall Chart when showing how individual changes over time or categories contribute to a final outcome, such as:

- *Revenue growth or decline over time*
- *Tracking the impact of various factors on a total value*

How to Choose

- Clearly label each "step" so viewers can easily see how each element contributes.
- It's great for showing movement from a starting point to an ending point, highlighting incremental changes.

Bubble Chart

Description

A Bubble Chart is a variation of the Scatter Chart, where the size of the marker (the "bubble") represents a third variable, and sometimes the color represents a fourth dimension. It is useful for showing relationships among three or more numeric variables.

- *City-Wise Sales Performance and Profitability*

When to Use

Use a Bubble Chart when you want to show the relationship among three or four numeric variables, and size matters as much as the position, such as:

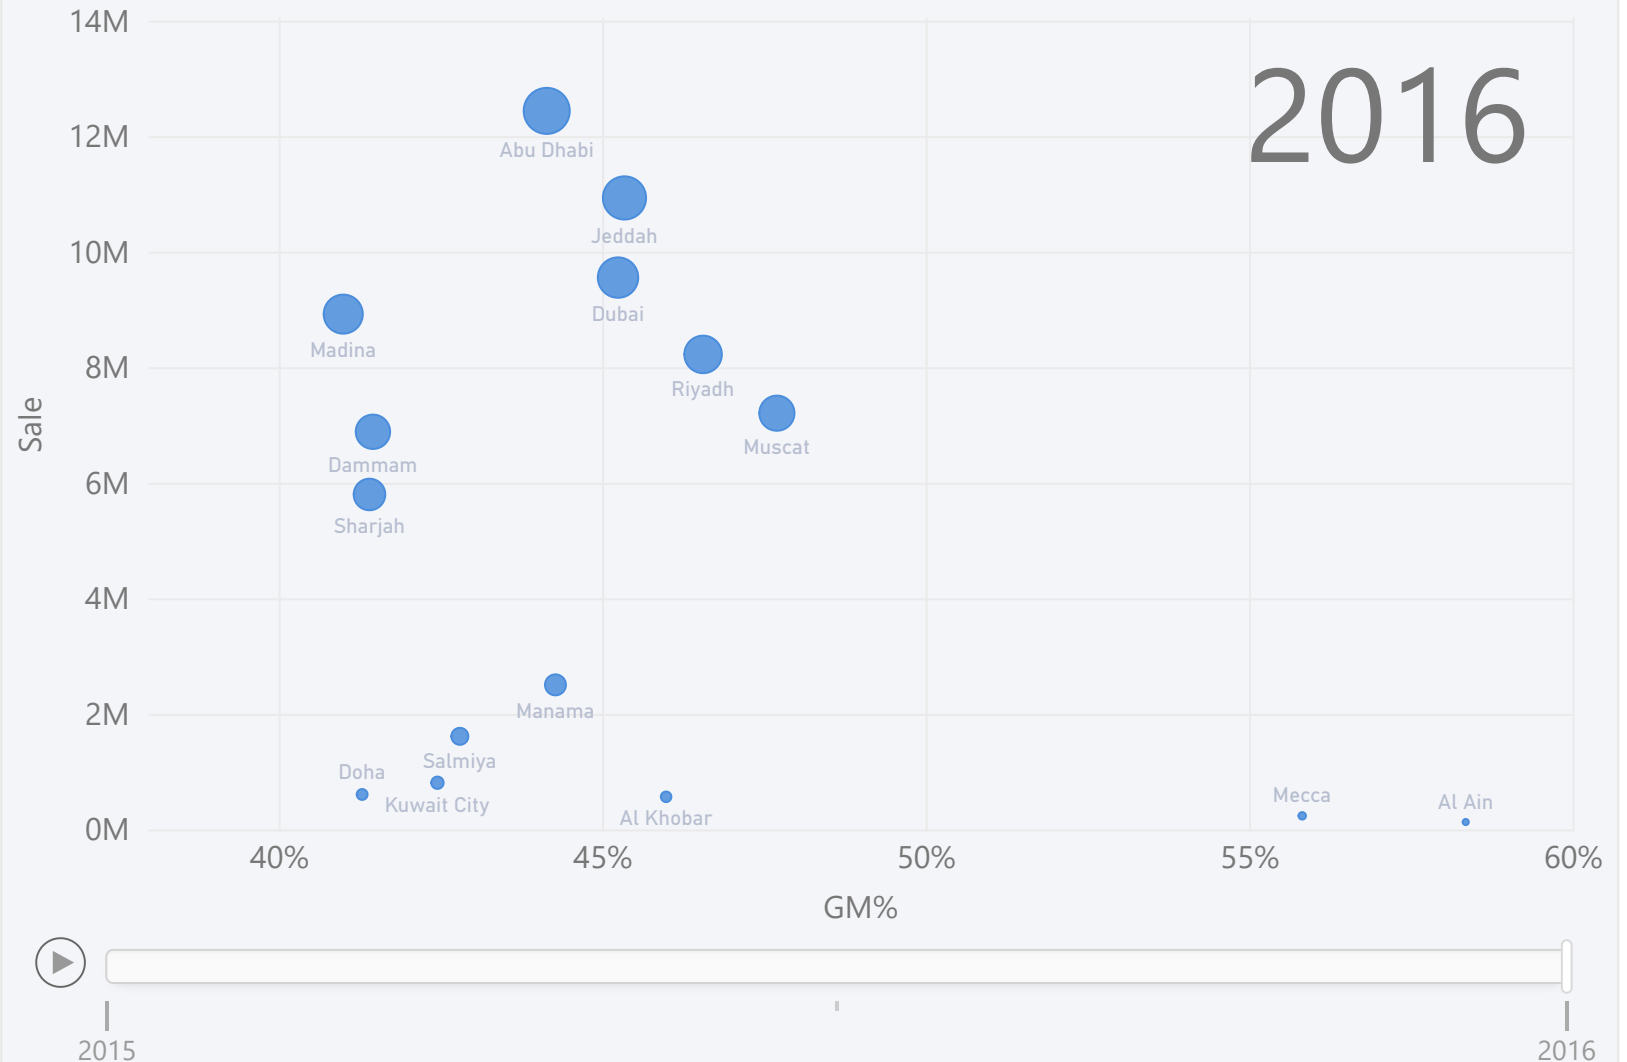

- *Sales vs. profitability across cities*
- *Market share vs. revenue and growth*

How to Choose

- Bubble charts are helpful when the volume or magnitude of a variable is important.
- Ensure that the bubble sizes are distinguishable to avoid making the chart confusing.

Bubble Chart

City-Wise Sales Performance and Profitability

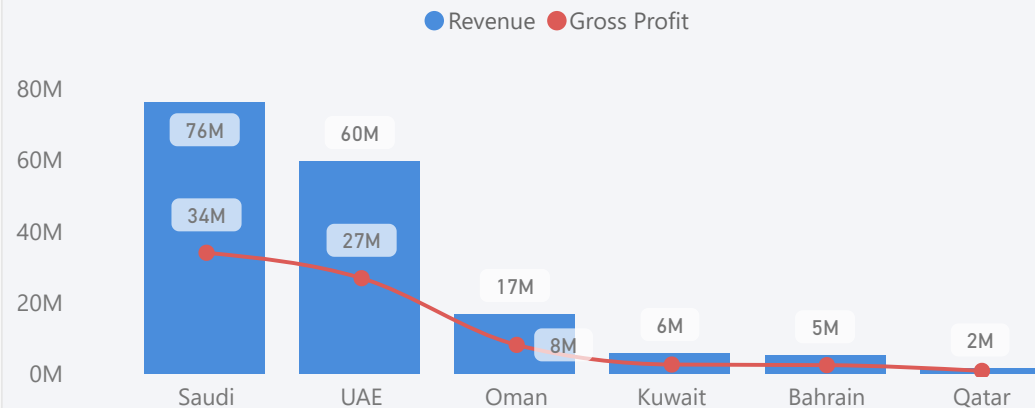

Line and Column Chart

Line and Column Chart

Revenue and Gross Profit by Country

Description

A Line and Column Chart combines a column chart with a line chart on the same axis, allowing you to compare or correlate two different measures. For example, it can show sales volume (columns) alongside profit margins (line).

- Revenue and Gross Profit by Country

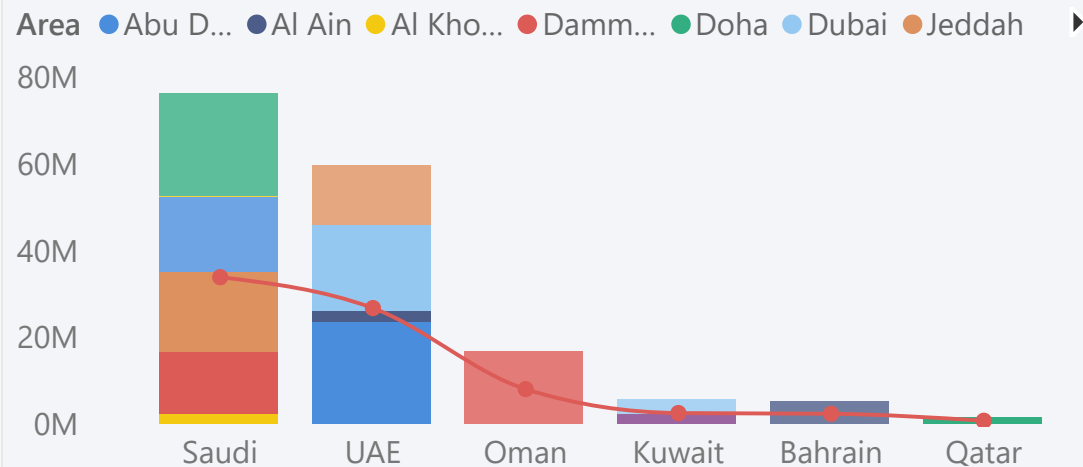

When to Use

Use this chart when you want to see if changes in one measure might be affecting or correlating with another measure over time, such as:

- Sales volume and profit margin comparison
- Tracking revenue and expenses

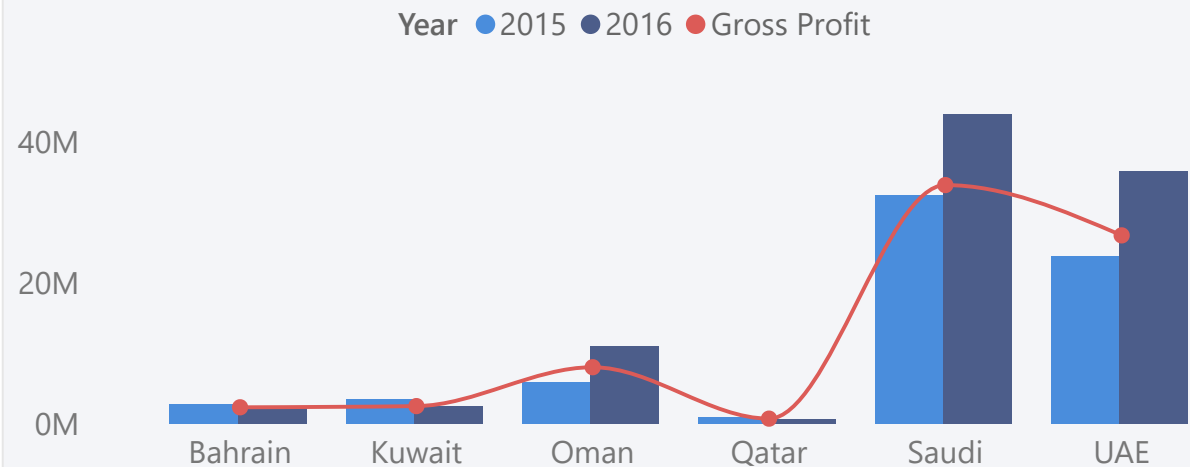

Line and Stacked Column Chart

Revenue and Gross Profit by Country and Area

Line and Clustered Column Chart

Revenue and Gross Profit by Country and Year

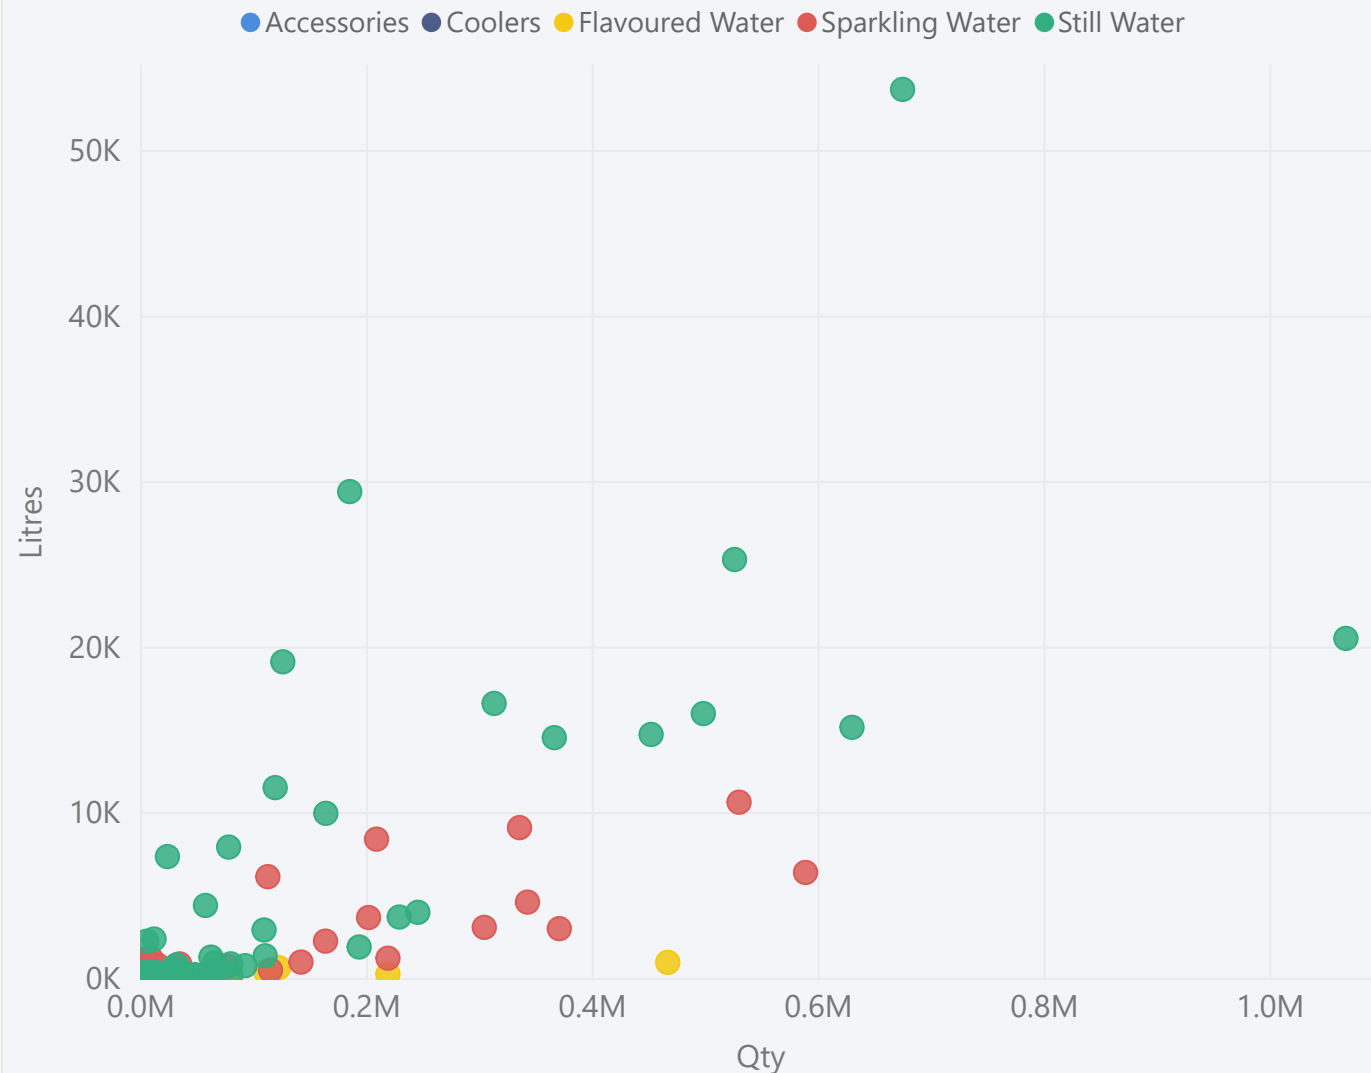

Scattered Chart

Scattered Chart

Qty and Litres by Sale and PSubCategory

Description

A Scatter Chart displays the relationship between two numeric variables, using a horizontal (x) axis and a vertical (y) axis. It helps to identify patterns or correlations between two measures.

- * *Quantity and Litres by Sale and Subcategory*

When to Use

Use a Scatter Chart when searching for correlation or patterns between two measures, such as:

- * *Height vs. weight*
- * *Marketing spend vs. new leads*

How to Choose

- * Add a trend line if you suspect a correlation between the variables.
- * Label the axes clearly and consider color-coding the data points by a third category for better clarity.

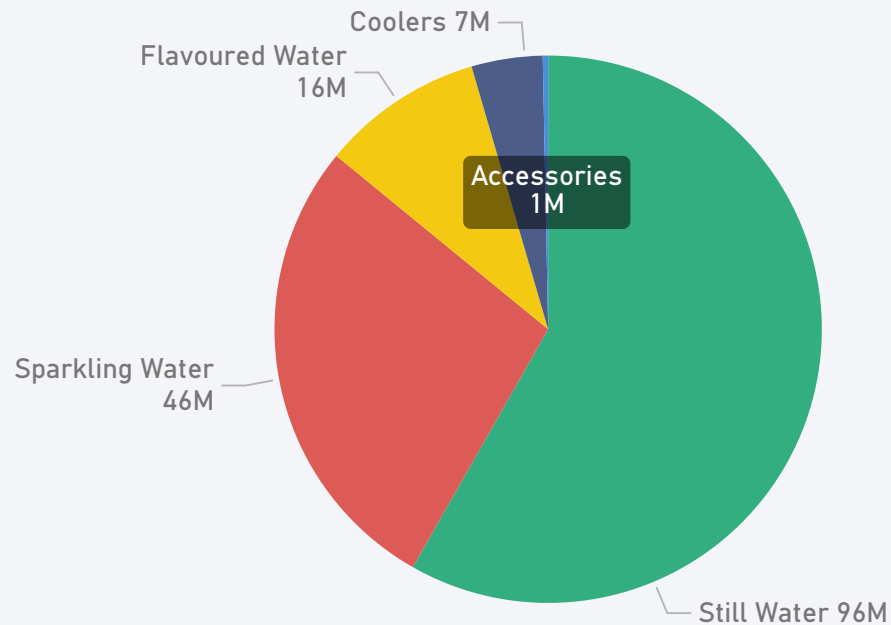

Pie Chart

Pie Chart

Sales Distribution by Product Sub-Category

Description

A Pie Chart breaks down a measure into slices, each representing a percentage of the total, providing a quick visual comparison of parts to the whole.

** Sales by Subcategory*

When to Use

Use a Pie Chart when you have a few categories (ideally 3-5) and need to see the share of each category relative to the total, such as:

- * Sales breakdown by product category*
- * Market share distribution among competitors*

How to Choose

- * Overuse of Pie Charts can be confusing, so only use them for a small number of categories.*
- * Ensure that the slices have distinct colors, and percentages are labeled for better clarity.*

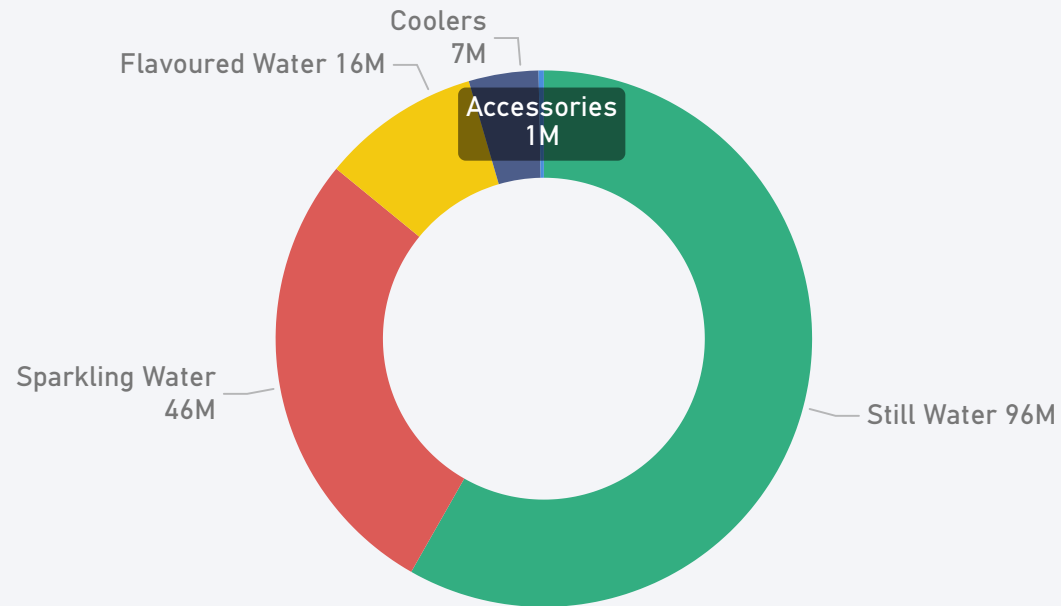

Donut Chart

Donut Chart

Product Sub-Category Sales Contribution

Description

A Donut Chart is essentially a Pie Chart with a blank center. It represents part-to-whole relationships, similar to a Pie Chart, but provides space in the middle for a central label or summary.

- *Sales by Subcategory*

When to Use

Use a Donut Chart when you want to follow the same guidelines as a Pie Chart, but need space in the middle to display key figures or additional context, such as:

- *Highlighting a key metric like total sales*
- *Displaying an important summary in the center*

How to Choose

- Follow the same guidelines as the Pie Chart, but use the center space for context or key information.

Decomposition Tree

Decomposition Tree

Revenue Breakdown by Country and City

Description

A Decomposition Tree breaks down a measure into its contributing factors step by step, letting you drill into root causes or subcategories. It's a visual way to explore how different fields contribute to a key metric.

• *Revenue by Country and Area*

When to Use

Use a Decomposition Tree when you want to diagnose or explore why a certain value is high or low, and when you need an interactive way to see how different fields affect a key metric. For example:

- *Analyzing why revenue is higher in one region or city than another*
- *Understanding how different factors contribute to overall performance*

How to Choose

- Ensure you have well-structured data with the fields you want to decompose.
- It works best in scenarios involving exploration or "what if" analysis.

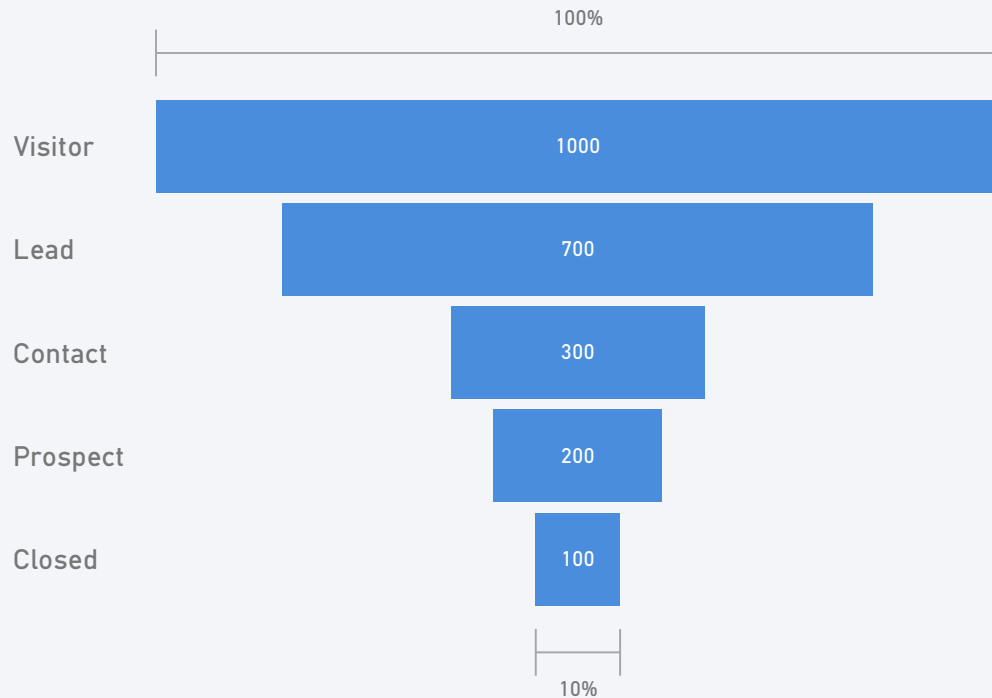

Funnel Chart

Funnel Chart

Lead Conversion Funnel by Stage

Description

A Funnel Chart shows values through multiple stages in a pipeline or process, such as the lead pipeline (leads → qualified → proposals → closed deals). It visualizes how data is reduced or "funnels down" at each stage of a linear process.

• *Sales Funnel – Visitor to Closed Deals*

When to Use

Use a Funnel Chart when you want to see how data is reduced at each stage of a process, such as:

- *Tracking leads through the sales funnel*
- *Monitoring order processes, project stages, etc.*

How to Choose

- It makes it easy to spot where the largest drop-off occurs in a sequence.
- Particularly useful for sales/marketing pipelines, order processes, or any sequential process where data shrinks at each step.

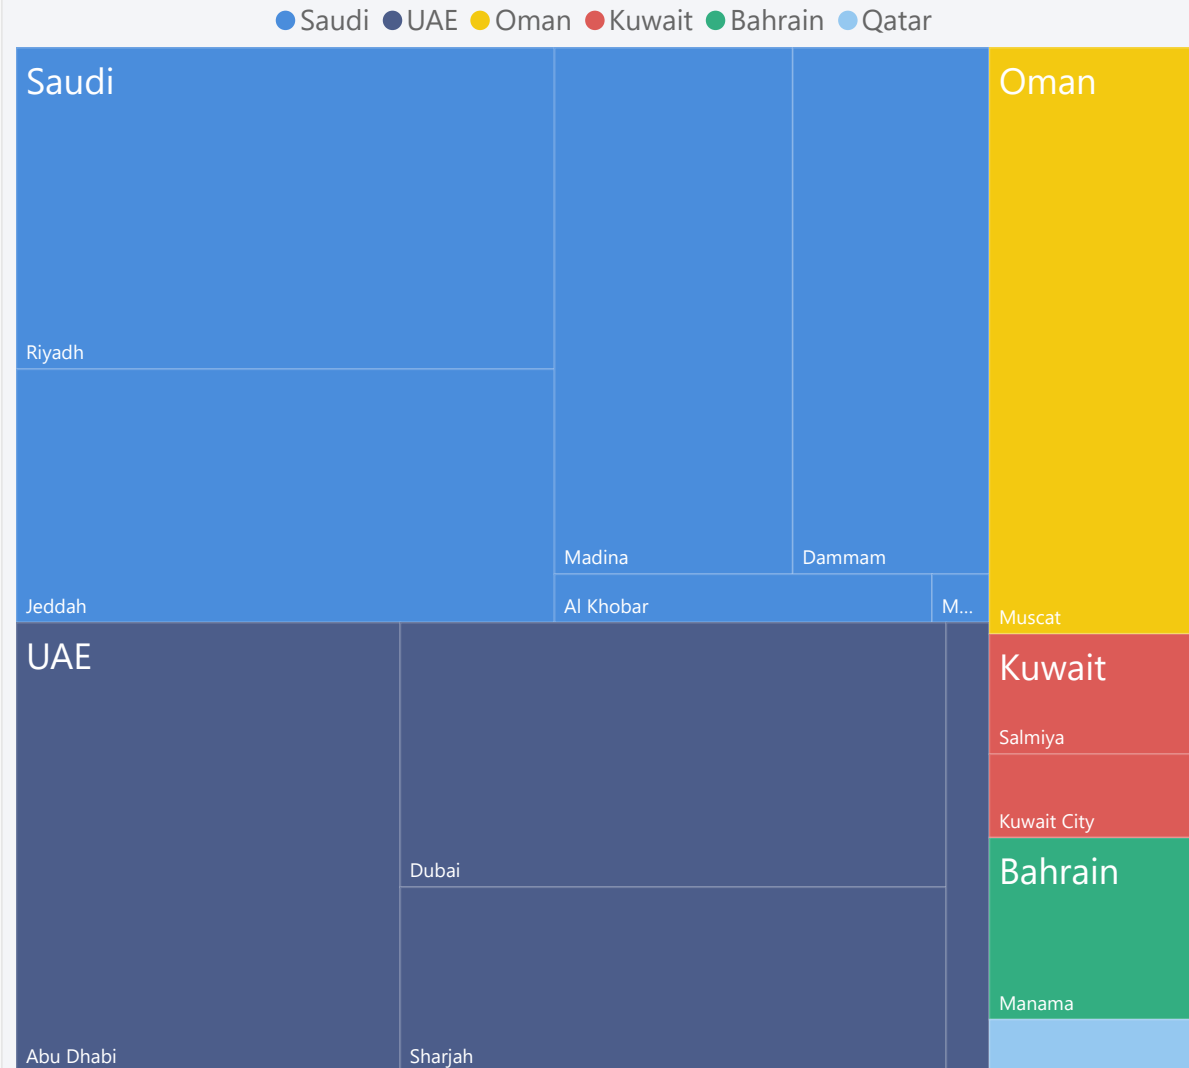

Tree Map

Treemap

Revenue by Country and Area

Description

A Tree Map uses nested rectangles of varying size to represent hierarchical or proportional data. Larger rectangles represent larger data points, and smaller ones represent smaller data points, making it easier to visualize how parts of a whole compare in size.

* *Revenue by Country and Area*

When to Use

Use a Tree Map when you want to show how parts of a hierarchy compare in size to each other or to the whole, such as:

- * *Revenue distribution by country and region*
- * *Sales by category and subcategory*

How to Choose

- * Tree Maps are particularly useful if you have a large number of categories that can be grouped in a hierarchy.
- * They are great for providing a quick, big-picture look at relative sizes across categories.

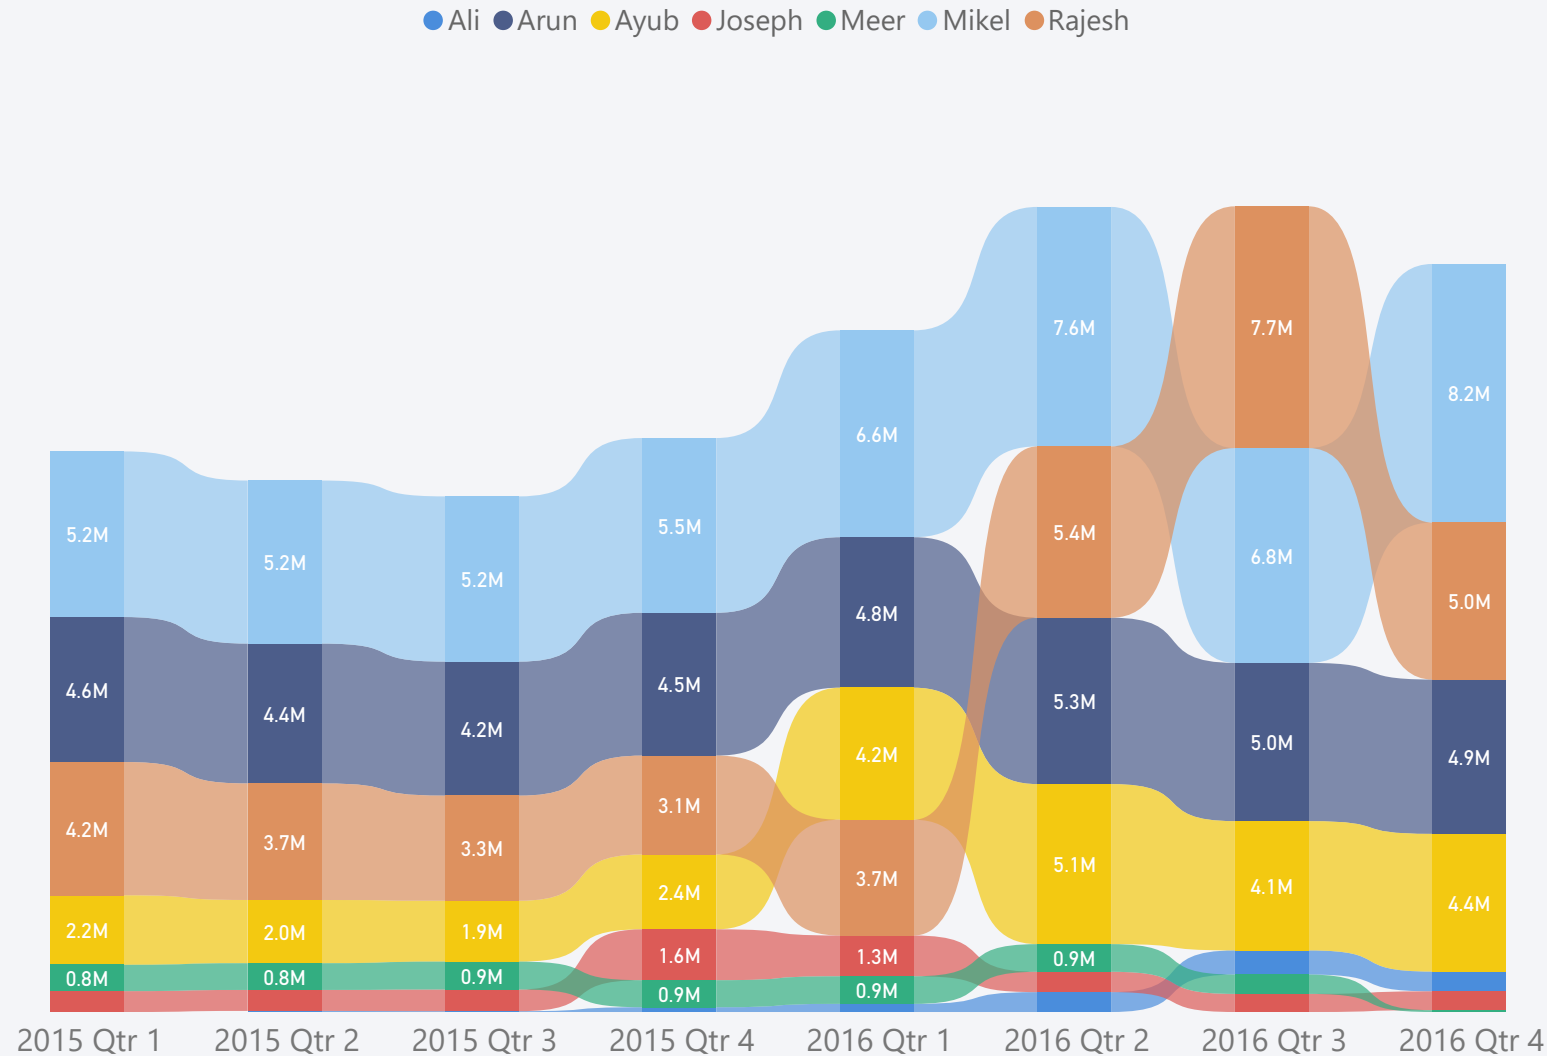

Ribbon Chart

Ribbon Chart

Quarterly Sales Trends by Regional Manager

Description

A Ribbon Chart ranks categories or subcategories over time or another dimension, with "ribbons" that change in thickness and position to indicate shifts in ranking. This chart is great for visualizing how categories move up and down in a ranking.

- Quarterly Sales Trends by Regional Manager

When to Use

Use a Ribbon Chart when you need to show how the top-ranked categories shift or how the ranking order changes over time, such as:

- Sales performance by team or region over multiple quarters
- Tracking shifts in rank or performance

How to Choose

- A Ribbon Chart is a great alternative to bar or line charts if the focus is on "who's on top" or "how the position changes over time."

Bubble Chart

Description

A Bubble Chart is a variation of the Scatter Chart, where the size of the marker (the "bubble") represents a third variable, and sometimes the color represents a fourth dimension. It is useful for showing relationships among three or more numeric variables.

- *City-Wise Sales Performance and Profitability*

When to Use

Use a Bubble Chart when you want to show the relationship among three or four numeric variables, and size matters as much as the position, such as:

- *Sales vs. profitability across cities*
- *Market share vs. revenue and growth*

How to Choose

- Bubble charts are helpful when the volume or magnitude of a variable is important.
- Ensure that the bubble sizes are distinguishable to avoid making the chart confusing.
